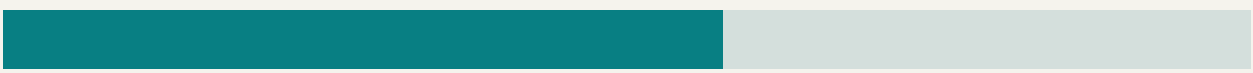
29,932 records. One product question.

Which wireless issues deserve a closer look?

17,280

wireless complaint reports in September 2025



Wireless: 57.7% Other: 12,652

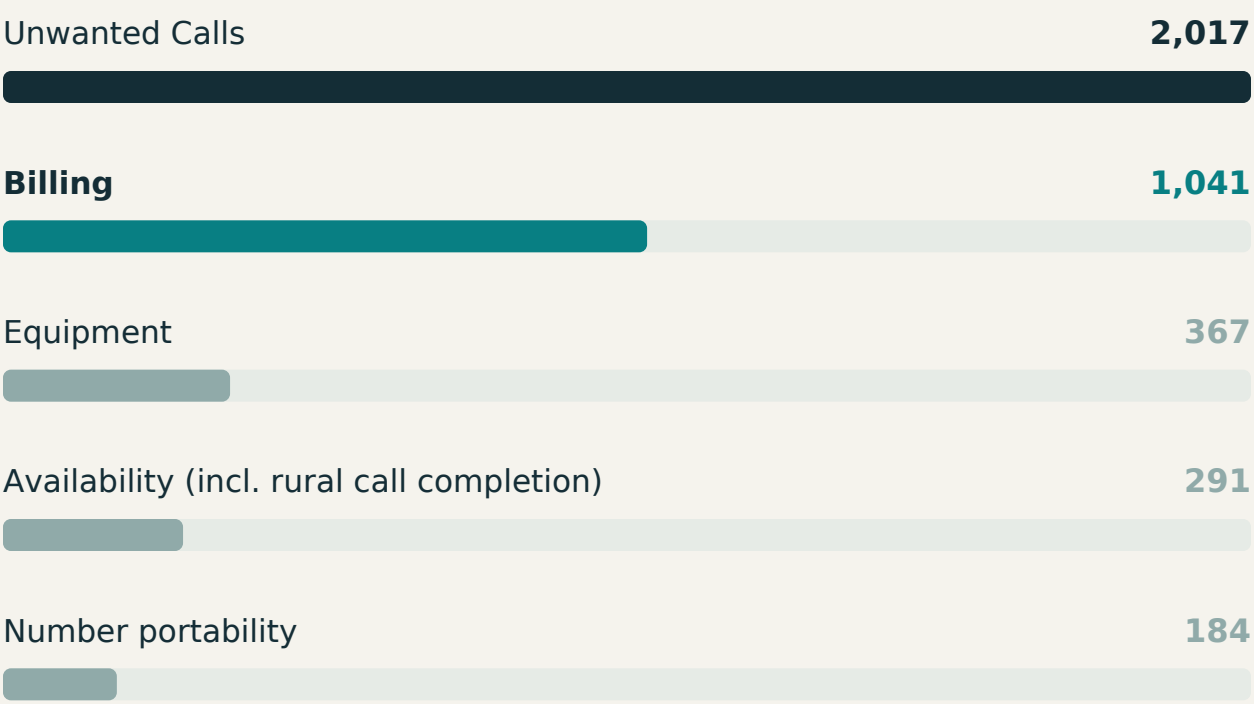
A complete API-to-data-product pipeline. Built with AI assistance, then tested for completeness, replay, and failure recovery.

Wireless = Phone/Internet records with a Wireless method.

Source: FCC public complaints | Sep 1-30, 2025 | Dataset 3xyp-aqkj

Unwanted calls led. Billing came next.

4,401 wireless reports | Sep 22-28, 2025



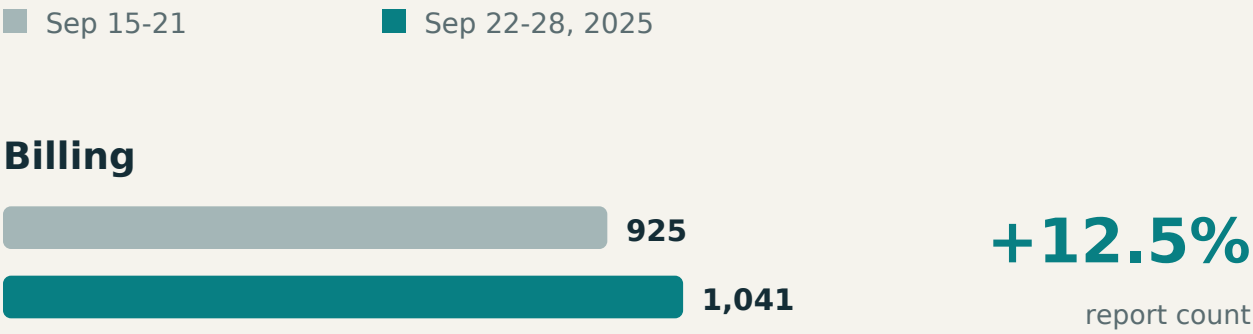
Bars share a zero baseline; lengths show report counts.

Billing represented 23.7% of that week's reports.

Source: FCC | Complete week Sep 22-28, 2025 | Counts, not subscriber rates

Billing +116. Portability +39.

Two signals. Different baselines.



Billing had the largest absolute increase across all 12 issues. Portability's larger percentage came from a smaller base.

Source: FCC | Consecutive complete weeks | Descriptive comparison only

The findings needed a trustworthy pipeline.

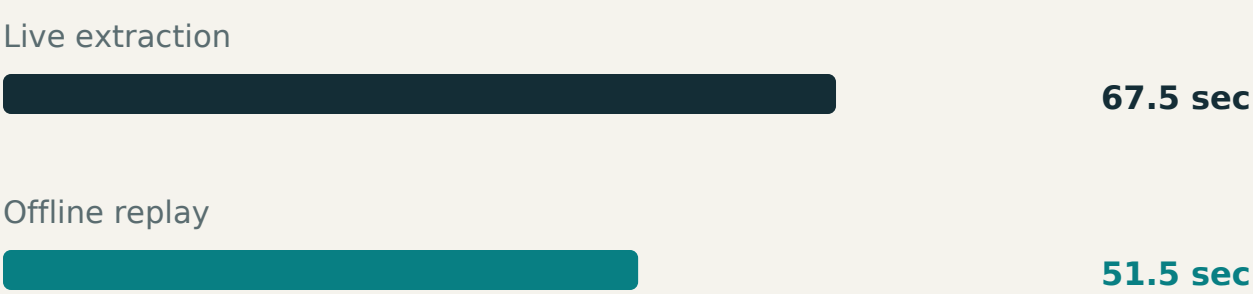
19

dbt data tests passed

19

Python reliability tests passed

Observed complete-pipeline runtime



Two observations in one Linux environment.
Installation excluded; these are not benchmark results.

LABELLED FAILURE-INJECTION CHECK

A forced dbt failure left the last successful data product available.

Source: Executed project reports | Python 3.12.14 | No model uplift claim

Investigate the signal. Measure the next step.

01 Billing

1,041 reports | +116 week over week

Review billing complaint themes;
seek independent corroboration.

02 Number portability

184 reports | +39 week over week

Investigate number-transfer friction;
keep the smaller base visible.

03 Measure the research process

Investigation yield + time-to-detection

Product uplift requires a separate
evaluation with appropriate denominators.

Self-selected reports; allegations are not verified by the FCC.
No subscriber denominator. No churn or causal conclusion.
